## **Associated Health Issues**

Beneficial Bacteria	Role in Gut Health	Foods to Promote Their Growth	Diseases Associated with Lack
1. Lactobacillus	Produces lactic acid; inhibits harmful bacteria; supports digestion and immune function	Yogurt with live cultures, kefir, sauerkraut, kimchi, miso, tempeh	Increased risk of gastrointestinal infections, diarrhea, and weakened immune function
2. Bifidobacterium	Ferments dietary fibers; produces SCFAs; supports immune function	Yogurt, kefir, fermented vegetables, whole grains, bananas, onions, garlic, asparagus	Higher susceptibility to IBD, IBS, allergies, and infections
3. Akkermansia muciniphila	Maintains gut lining integrity; supports metabolism; anti-inflammatory effects	Cranberries, pomegranates, grapes, polyphenol-rich foods, fish oil, prebiotic fibers	Obesity, metabolic disorders (e.g., type 2 diabetes), inflammation
4. Faecalibacterium prausnitzii	Produces butyrate (a SCFA); anti-inflammatory effects; supports colon health	Bananas, apples, barley, oats, resistant starches, inulin-rich foods	Increased risk of IBD, especially Crohn's disease
5. Roseburia	Produces butyrate; supports gut lining; anti-inflammatory effects	Whole grains, dietary fibers, resistant starches, inulin-rich foods	Obesity, insulin resistance, metabolic syndrome, and IBD
6. Ruminococcus	Breaks down complex carbohydrates; produces SCFAs	Whole grains, dietary fibers, prebiotic-rich foods	IBS, IBD, reduced SCFA production
7. Prevotella	Ferments fibers; produces SCFAs; associated with high- fiber diets	High-fiber plant foods, whole grains, legumes, fruits, vegetables	Reduced SCFA production; potential impact on glucose metabolism
8. Eubacterium	Produces butyrate; supports gut health	Dietary fibers from whole grains, fruits, vegetables	IBD, colorectal cancer, inflammatory conditions
9. Bacteroides	Breaks down complex molecules; produces SCFAs	High-fiber foods, complex carbohydrates, vegetables, legumes	Digestive disorders; imbalance may relate to obesity and insulin resistance
10. Streptococcus thermophilus	Produces lactase; supports lactose	Yogurt, fermented dairy products	Lactose intolerance symptoms, impaired

Beneficial Bacteria	Role in Gut Health	Foods to Promote Their Growth	Diseases Associated with Lack
	digestion; produces beneficial compounds		digestion of dairy products
11. Lactococcus lactis	Produces lactic acid; used in cheese making; supports gut health	Fermented dairy products like cheese, buttermilk	Digestive discomfort; less direct evidence of disease association
12. Bifidobacterium longum	Ferments fibers; produces SCFAs; supports immune function	Yogurt, kefir, fermented foods, prebiotic fibers	Increased susceptibility to infections, allergies, digestive disorders
13. Lactobacillus plantarum	Produces lactic acid; supports gut barrier; antioxidant properties	Fermented foods like sauerkraut, kimchi, pickles	Digestive issues, inflammation, weakened gut barrier
14. Leuconostoc	Produces lactic acid and CO <sub>2</sub> ; used in vegetable fermentation	Sauerkraut, kimchi, fermented vegetables	Not well-defined; generally supports gut health
15. Pediococcus	Produces lactic acid; contributes to fermented foods	Fermented foods like sauerkraut, kimchi, fermented sausages	Not well-defined; generally supports gut health
16. Propionibacterium freudenreichii	Produces propionate (a SCFA); supports gut health; synthesizes vitamin B12	Swiss-type cheeses like Emmental, Jarlsberg, and Swiss cheese	Vitamin B12 deficiency, digestive issues
17. Bacillus coagulans	Spore-forming probiotic; survives stomach acid; supports digestion	Fermented foods, probiotic supplements	Digestive discomfort, IBS symptoms
18. Clostridium cluster XIVa (e.g., Eubacterium rectale)	Produces butyrate; supports colon health; anti-inflammatory effects	High-fiber foods, resistant starches, whole grains, fruits, vegetables	IBD, colorectal cancer, inflammatory conditions
19. Collinsella	Involved in carbohydrate metabolism; produces SCFAs	High-fiber foods, whole grains, legumes	Imbalance may be associated with metabolic disorders
20. Blautia	Produces SCFAs; anti- inflammatory properties	High-fiber foods, whole grains, legumes, fruits, vegetables	Inflammation, metabolic disorders
21. Coprococcus	Produces butyrate; associated with mental health	High-fiber foods, whole grains, fruits, vegetables	Linked to depression and mental health disorders

Beneficial Bacteria	Role in Gut Health	Foods to Promote Their Growth	Diseases Associated with Lack
22. Bifidobacterium bifidum	Supports immune function; inhibits harmful bacteria	Yogurt, kefir, fermented foods, prebiotic fibers	Increased risk of infections, allergies, digestive issues
23. Lactobacillus rhamnosus	Supports gut barrier; may improve mood and reduce anxiety	Yogurt with live cultures, kefir, fermented foods	Digestive issues, anxiety, mood disorders
24. Streptococcus salivarius	Produces beneficial enzymes; supports oral and gut health	Yogurt, fermented dairy products	Oral health issues, throat infections
25. Weissella	Produces lactic acid; contributes to fermented foods	Fermented vegetables, kimchi, sourdough bread	Not well-defined; generally supports gut health

## **Key Points**

- **Gut Microbiome Balance**: A balanced and diverse gut microbiome is crucial for overall health. Imbalances (dysbiosis) can contribute to various health issues.
- Short-Chain Fatty Acids (SCFAs): Many beneficial bacteria produce SCFAs like butyrate, acetate, and propionate, which are important for colon health, immune function, and reducing inflammation.
- **Dietary Influence**: Diet is one of the most significant factors influencing the composition of the gut microbiome. Consuming a variety of fibers, prebiotics, and probiotics supports beneficial bacteria.
- **Disease Associations**: Conditions such as inflammatory bowel disease (IBD), irritable bowel syndrome (IBS), obesity, metabolic disorders, mental health issues, and allergies have been linked to gut microbiome imbalances.

## **Additional Tips**

- **Consult Healthcare Professionals**: For concerns about gut health or related diseases, consult a healthcare provider or a gastroenterologist.
- **Personalization**: Individual gut microbiomes vary greatly. What promotes beneficial bacteria in one person may differ in another.
- **Lifestyle Factors**: Besides diet, factors such as stress, sleep, exercise, and antibiotic use can affect gut bacteria.
